Abstract

Edwards curves were the first curves shown to have a complete addition law. However, the completeness of the addition law depends on the curve parameters and even a complete Edwards curve becomes incomplete over a quadratic field extension. This paper covers arbitrary Edwards curves and gives a set of two addition laws that for any pair of input points $P_1, P_2$ produce the sum $P_1 + P_2$.

Key words: Elliptic curves, Edwards curves, complete addition law, points at infinity.

1. Introduction

This paper presents a complete set of two addition laws for arbitrary Edwards curves, and more generally twisted Edwards curves, embedded into $\mathbb{P}^1 \times \mathbb{P}^1$. Specifically, what this paper shows is that

\[
((X_1 : Z_1), (Y_1 : T_1)) + ((X_2 : Z_2), (Y_2 : T_2)) =
\begin{cases}
((X_1Y_2Z_2T_1 + X_2Y_1Z_1T_2 : Z_1Z_2T_1T_2 + dX_1X_2Y_1Y_2), & \text{if defined,} \\
(Y_1Y_2Z_1Z_2 - aX_1X_2T_1T_2 : Z_1Z_2T_1T_2 - dX_1X_2Y_1Y_2) & \text{if defined}
\end{cases}
\]

is a complete set of addition laws for the curve

\[
E_{a,d} = \{((X : Z), (Y : T)) \in \mathbb{P}^1 \times \mathbb{P}^1 : aX^2T^2 + Y^2Z^2 = Z^2T^2 + dX^2Y^2\}
\]

whenever $a, d$ are distinct nonzero elements of a field $k$ with $\text{char}(k) \neq 2$. These two addition laws cover all possible pairs of curve points; the outputs coincide if they are both defined; each defined output is on the curve; and this addition turns the set of curve points into a group.

For Weierstrass curves embedded in $\mathbb{P}^2$, Bosma and Lenstra proved in [6] that the minimal cardinality of a complete set of addition laws is 2, and they provided a complete set of 2 addition laws, improving upon the set of 3 addition laws given in [12] (and earlier in [11] Section 3) for the case of short Weierstrass
\[(X_1 : Y_1 : Z_1) + (X_2 : Y_2 : Z_2) =
\begin{cases}
(a_4 X_2^2 Z_2^2 - 2X_1 Y_1 Z_1 X_2 - X_1 Z_1 Y_1^2 + 3a_6 X_1 Z_1 Z_2^2 \\
+ Y_1^2 X_2 Z_1 + 2Y_1 Z_1 X_2 Y_2 - a_4 Z_1^2 X_2^2 - 3a_6 Z_1^2 X_2 Z_2 : \\
3X_1^2 Y_2 Z_2 - 3X_1 Y_1 Z_2^2 - a_4 X_1 Y_1 Z_2^2 + 2a_4 X_1 Z_1 Y_2 Z_2 + Y_1^2 Z_2^2 \\
- 2a_4 Y_1 Z_1 X_2 Z_2 - Y_1 Z_1 Y_2^2 - 3a_6 Y_1 Z_1 Z_2^2 + a_4 Z_1^2 X_2 Y_2 + 3a_6 Z_1^2 Y_2 Z_2 : \\
- 3X_1^2 X_2 Z_2 + 3X_1 Z_1 X_2^2 - a_4 X_1 Z_1 Z_2^2 + Y_1^2 Z_2^2 + a_4 Z_1^2 X_2 Z_2 - Z_1^2 Y_1^2)
\end{cases}
\text{if defined},
\begin{align*}
& (a_4 X_2^2 Z_2 + X_1^2 Y_2^2 + 3a_6 Z_2^2 - a_4 X_1 Z_1 X_2^2 \\
& - a_4 X_1^2 Y_2^2 - Y_1^2 X_2^2 - 3a_6 Z_1^2 X_2 Z_2 + a_4^2 Z_1^2 X_2^2 \\
& + a_4 X_1 Y_1 X_2 Z_2 + 6a_6 X_1 Z_1 Y_2 Z_2 - Y_1^2 Z_2 Z_2 - a_4 Y_1 Z_1 X_2^2 \\
& - 6a_6 Y_1 Z_1 X_2 Z_2 + a_4^2 Y_1 Z_1 Z_2^2 + 3a_6 Z_1^2 X_2 Y_2 - a_4^2 Z_1^2 Y_2 Z_2 : \\
& - a_4 X_1^2 Z_2^2 - 2X_1 Y_1 Z_2^2 + X_1 Z_1 Y_2^2 - 3a_6 X_1 Z_1 Z_2^2 \\
& - Y_1^2 X_2 Z_2 + 2Y_1 Z_1 X_2 Z_2 + a_4^2 Z_2^2 + 3a_6 Z_1^2 Z_2 Z_2)
\end{align*}
\text{if defined},
\begin{align*}
& (-2a_4 X_1^2 Y_2 Z_2 - 4a_4 X_1 Y_1 Z_2^2 + 2X_1 Y_1 Y_2^2 - 6a_6 X_1 Y_1 Z_2^2 \\
& - 4a_4 X_1 Z_1 X_2 Y_2 - 12a_6 X_1 Z_1 Y_2 Z_2 + 2Y_1^2 Y_2 X_2 - 2a_4 Y_1 Z_1 X_2^2 \\
& - 12a_6 Y_1 Z_1 X_2 Z_2 + 2a_4 Y_1 Z_1 Z_2 Z_2^2 - 6a_6 Z_1^2 X_2 Y_2 + a_4 Z_1^2 X_2 Z_2 : \\
& 6a_4 Y_1 X_1 Z_1 X_2 Z_2 - 18a_4 X_1^2 Z_1 X_2 - 2a_4^2 X_1^2 Z_1 Z_2^2 + 18a_4 X_1 Z_1 X_2^2 \\
& - 8a_4 X_1 Z_1 Z_2^2 - 6a_4 a_6 X_1 Z_1 Z_2^2 + 2Y_1^2 Z_1 X_2^2 - a_4^2 Z_1^2 Z_2^2 \\
& - 6a_4 a_6 Z_1 Z_2 Z_2^2 + 2Y_1^2 Y_2 Z_2 \\
& 6X_1^2 X_2 Y_2 + 6X_1 Y_1 X_2^2 + 2a_4 X_1 Z_1 Y_2 Z_2 + 4a_4 X_1 Z_1 Y_2 Z_2 + 2Y_1^2 Y_2 Z_2 \\
& + 4a_4 Y_1 Z_1 X_2 Z_2 + 2Y_1 Z_1 Y_2^2 + 6a_6 Y_1 Z_1 Z_2^2 + 2a_4 Z_2^2 X_2 Y_2 + 6a_6 Z_1^2 Z_2 Z_2)
\end{align*}
\text{if defined}.

Figure 1.1: The H. Lange–Ruppert complete set of three addition laws for a short Weierstrass curve \((X : Y : Z) \in \mathbb{P}^2 : Y^2 Z = X^3 + a_4 X Z^2 + a_6 Z^3\). We obtained this from [12] Proposition 2.1 by substituting \(a_1 = a_2 = a_3 = 0\); replacing “(x0 : x1 : x2)” with \((Z_1 : X_1 : Y_1)\), “(y0 : y1 : y2)” with \((Z_2 : X_2 : Y_2)\), etc.; and sorting terms. For more general Weierstrass curves except in characteristic 2, see [12] Proposition 2.1 with the correction stated by Bosma and Lenstra in [5] page 240, namely changing \(a_1 b_6 + a_3 b_4\) to “a1 b6 + a3 a4”. For characteristic 2, see [13] Theorem 2.2, and note the change of scale from “\(Z^{(3)}\)” to “\(Z^{(5)}\)”.

curves). For elliptic curves in other shapes no similar result was known until now. H. Lange and Ruppert had shown in [11] that any abelian variety has a complete system of low-degree addition laws, but had also commented that “The proof is nonconstructive . . . To determine explicitly a complete system of addition laws requires tedious computations already in the easiest case of an elliptic curve in Weierstrass normal form.” See Figure 1.1 for the H. Lange–Ruppert laws (in the short-Weierstrass case), and Figure 1.2 for the Bosma–Lenstra laws.

The addition laws in this paper are much simpler, much easier to prove, and much more efficient than the addition laws in [11], [12], and [6]. Applications of elliptic-curve groups in cryptography and computer algebra can use the \(E_{\text{a,d}}\) group for any curve expressible in twisted Edwards form, often gaining speed without creating any troublesome failure cases. Note that every elliptic curve outside characteristic 2 can be expressed in Edwards form at the expense of a small field extension; see [2] Theorem 3.3]. Note also that our addition laws are open (i.e., each law computes \(P + Q\) for a nonempty open set of pairs \((P, Q)\), as in [11], [12], and [6]) and therefore usable for elliptic-curve addition over any finite ring containing 1/2, by an adaptation of the procedures discussed in [13] Section 3 and [6] page 231.

For affine inputs \((x : 1), (y : 1)\), our first addition law is exactly the Edwards addition law. We showed in [4] Theorem 3.3] that the Edwards addition law for the Edwards curve \(x^2 + y^2 = 1 + dx^2 y^2\) has no exceptional cases defined over \(k\) if the curve parameter \(d\) is not a square in \(k\). More generally, the Edwards
addition law for the twisted Edwards curve $ax^2 + y^2 = 1 + dx^2y^2$ has no exceptional cases if $d$ and $a/d$ are not squares in $k$. However, over $k(\sqrt{d})$ or $k(\sqrt{a/d})$ there are points at infinity, and no study of how to handle these points has appeared in the literature.

Hisil et al. in [9] introduced a different addition law on affine twisted Edwards curves, and showed for generic pairs of input points that the addition law produces the same results as the Edwards addition law. Our second addition law is, for affine inputs, exactly the addition law from Hisil et al. It turns out that, on the closure of the curve in $P^1 \times P^1$, this second law handles all of the inputs and outputs at infinity that are not handled by the first law. We refer to the second addition law as the “dual addition law” for reasons discussed in Section 8, and we refer to the first addition law as the “original addition law”.

Note that for a doubling (i.e., an addition where both inputs are the same) one can simplify the formulas with the help of the curve equation. Readers interested in the exact speed of explicit formulas for the original addition law, the dual addition law, doublings, triplings, etc. should consult, e.g., [1], [2], [9], and [3]. See the Explicit-Formulas Database [5] for a broader view covering many more curve shapes.

2. Review of Edwards curves

Edwards in [7] introduced a new normal form of elliptic curves. He showed that every elliptic curve over $Q$ can be written in this normal form over an extension of $Q$. More generally, every elliptic curve over a field $k$ with $2 \neq 0$ can be written in this normal form over an extension of $k$. To reduce the need for extensions we use the slightly generalized form of Edwards curves introduced in [3].

An Edwards curve, at the level of generality of [3], is given by an equation of the form $x^2 + y^2 = 1 + dx^2y^2$, for some $d \not\in \{0, 1\}$. The Edwards addition law is given by

$$(x_1, y_1), (x_2, y_2) \mapsto \left( \frac{x_1y_2 + y_1x_2}{1 + dx_1x_2y_1y_2}, \frac{y_1y_2 - x_1x_2}{1 - dx_1x_2y_1y_2} \right).$$
The addition law is strongly unified; i.e., the same formulas can also be used for doubling. The point \((0, 1)\) is the neutral element of the addition law. The negative of a point \((x, y)\) is \((-x, y)\).

If \(d\) is not a square then, by [4, Theorem 3.3], the Edwards addition law is complete: the denominators \(1 + dx_1x_2y_1y_2\) and \(1 - dx_1x_2y_1y_2\) are always nonzero, and the points \((x, y)\) on the curve form a group. However, if \(d\) is a square then the addition law is not necessarily a group law: there can be pairs \((x_1, y_1)\) and \((x_2, y_2)\) where \(1 + dx_1x_2y_1y_2 = 0\) or \(1 - dx_1x_2y_1y_2 = 0\).

3. Review of twisted Edwards curves

For some additional generality we use the twisted Edwards curve \(E_{a,d}(x, y) = ax^2 + y^2 = 1 + dx^2y^2\), where \(a, d\) are distinct nonzero elements of \(k\). We introduced this generalization together with Birkner, Joye, and Peters in [2].

The Edwards addition law generalizes immediately to the addition law for an Edwards curve. The neutral element and negation are unchanged.

The twisted Edwards curve \(E_{a,d}(x, y) = ax^2 + y^2 = 1 + dx^2y^2\) is birationally equivalent to the Montgomery curve \(E_{A,B}(x, y) = Bx^2 = u^3 + Au^2 + u\), where \(A = 2(a + d)/(a - d)\) and \(B = 4/(a - d)\). The map \((x, y) \mapsto (u, v) = ((1 + y)/(1 - y), (1 + y)/(1 - y))\) is a birational equivalence from \(E_{a,d}\) to \(E_{A,B}\), with inverse \((u, v) \mapsto (x, y) = (u/v, (u - 1)/(u + 1))\).

As pointed out in [2], the map from \(E_{a,d}\) is undefined at \((0, 0)\), at \((-1, \pm \sqrt{(A - 2)/B}) = (-1, \pm \sqrt{d})\), and at \((-A \pm \sqrt{A^2 - 4})/2, 0) = ((1 + \sqrt{a/d})/(1 \pm \sqrt{a/d}), 0)\); furthermore, the point at infinity on \(E_{A,B}\) is not covered by the map between affine curves. To study the corresponding points on \(E_{a,d}\), we consider two different embeddings of the affine curve, first into \(P^2\) (Section 4) and then into \(P^1 \times P^1\) (Section 5).

4. Embedding of \(E_{a,d}\) into \(P^2\)

The projective closure of \(E_{a,d}\) in \(P^2\) is

\[\{ (X : Y : Z) \in P^2 : ax^2z^2 + y^2z^2 = Z^4 + dx^2y^2 \}.\]

This curve consists of the points \((x, y)\) on the affine curve \(E_{a,d}\), embedded as usual into \(P^2\) by \((x, y) \mapsto (x : y : 1)\), and extra points at infinity, i.e., points where \(Z = 0\). There are exactly two such points, namely \(\Omega_1 = (1 : 0 : 0)\) and \(\Omega_2 = (0 : 1 : 0)\). These points are singular.

A blowup of \(E_{a,d}\) around \(\Omega_1\) is \(a + \bar{y}^2z^2 = z^2 + dy^2\), where we put \(y = \bar{y}z\). Above \(\Omega_1\) there are two distinct points \((\bar{y}, z) = (\pm \sqrt{a/d}, 0)\). These points are minimally defined over \(k(\sqrt{a/d})\).

A blowup of \(E_{a,d}\) around \(\Omega_2\) is \(ax^2z^2 + 1 = z^2 + dx^2\), where we put \(x = \bar{x}z\). Above \(\Omega_2\) there are two distinct points \((\bar{x}, z) = (\pm 1/\sqrt{d}, 0)\). These points are minimally defined over \(k(\sqrt{d})\).

This projective closure is useful for computations in two ways. First, expressing the addition law on coordinates \((X : Y : Z)\) avoids inversions and leads to extremely fast arithmetic, as discussed in [4]. Second, the points \(\Omega_1\) and \(\Omega_2\) are important in formulating a geometric interpretation of the addition law, as used in computing pairings; see [3].

If \(d\) and \(a/d\) are not squares then the \(k\)-rational points of the projective closure are the \(k\)-rational points of the affine curve and form a group. However, one cannot distinguish the points over \(\Omega_1\) if \(a/d\) is a square, or over \(\Omega_2\) if \(d\) is a square; either way, the points of the projective closure do not form a group.
5. Embedding of \( E_{E,a,d} \) into \( \mathbb{P}^1 \times \mathbb{P}^1 \)

The projective closure of \( E_{E,a,d} \) in \( \mathbb{P}^1 \times \mathbb{P}^1 \) is

\[
\overline{E}_{E,a,d} = \{( (X : Z), (Y : T) ) \in \mathbb{P}^1 \times \mathbb{P}^1 : aX^2T^2 + Y^2Z^2 = Z^2T^2 + dX^2Y^2 \}.
\]

This curve consists of the points \( (x, y) \) on the affine curve \( E_{E,a,d} \), embedded as usual into \( \mathbb{P}^1 \times \mathbb{P}^1 \) by \( (x, y) \mapsto ((x : 1), (y : 1)) \), and extra points at infinity, i.e., points where \( (X : Z) = (1 : 0) \) or \( (Y : T) = (1 : 0) \).

At \( (X : Z) = (1 : 0) \) the curve equation is \( aT^2 = dY^2 \). There are two points here, namely \( ((X : Z), (Y : T)) = ((1 : 0), (\pm \sqrt{a/d} : 1)) \). These points are minimally defined over \( k(\sqrt{a/d}) \).

At \( (Y : T) = (1 : 0) \) the curve equation is \( Z^2 = dX^2 \). There are also two points here, namely \( ((X : Z), (Y : T)) = ((1 : \pm \sqrt{a/d}), (1 : 0)) \). These points are minimally defined over \( k(\sqrt{d}) \).

The rational map \( ((X : Z), (Y : T)) \mapsto (XT : YZ : TZ) \) from \( \mathbb{P}^1 \times \mathbb{P}^1 \) to \( \overline{E}_{E,a,d} \) is bijective on the affine points, maps both points \( ((1 : 0), (\pm \sqrt{a/d} : 1)) \) to \( \Omega_1 \), and maps both points \( ((1 : \pm \sqrt{d}), (1 : 0)) \) to \( \Omega_2 \).

6. Group law on \( \overline{E}_{E,a,d} \)

The original Edwards addition law readily generalizes to an addition law for \( \overline{E}_{E,a,d}(k) \), but it has exceptional cases if \( d \) or \( a/d \) is a square in \( k \). The dual addition law from Hisil et al. also generalizes to an addition law for \( \overline{E}_{E,a,d}(k) \), also having exceptional cases.

We show in this section that these two addition laws together form a complete set of addition laws for \( \overline{E}_{E,a,d} \). Specifically, for each pair of points \( P_1, P_2 \in \overline{E}_{E,a,d} \) at least one of the addition laws produces output in \( \mathbb{P}^1 \times \mathbb{P}^1 \); furthermore, if both addition laws produce output in \( \mathbb{P}^1 \times \mathbb{P}^1 \), then the outputs are the same; finally, each output in \( \mathbb{P}^1 \times \mathbb{P}^1 \) is in \( \overline{E}_{E,a,d} \). We denote the resulting element of \( \overline{E}_{E,a,d}(k) \) as \( P_1 + P_2 \).

We show later in the paper that this addition on \( \overline{E}_{E,a,d}(k) \) matches, in all cases, standard chord-and-tangent addition on the Montgomery curve \( E_{M,A,B} \) where \( A = 2(a + d)/(a - d) \) and \( B = 4/(a - d) \). Consequently \( \overline{E}_{E,a,d}(k) \) is a group. The fact that \( \overline{E}_{E,a,d}(k) \) is a group can also be proven directly.

Our proof that outputs from the original addition law are in \( \overline{E}_{E,a,d} \) generalizes \[4, Theorem 3.1\] from affine points on Edwards curves to arbitrary points on twisted Edwards curves. Our proof that outputs from the dual addition law are in \( \overline{E}_{E,a,d} \) is new.

**Theorem 6.1.** Fix a field \( k \) with \( \text{char}(k) \neq 2 \). Fix distinct nonzero elements \( a, d \in k \). Fix \( P_1, P_2 \in \overline{E}_{E,a,d}(k) \). Write \( P_1 \) as \( ((X_1 : Z_1), (Y_1 : T_1)) \) and write \( P_2 \) as \( ((X_2 : Z_2), (Y_2 : T_2)) \). Define

\[
X_3 = X_1Y_2Z_2T_1 + X_2Y_1Z_1T_2,
\]

\[
Z_3 = Z_1Z_2T_1T_2 + dX_1X_2Y_1Y_2,
\]

\[
Y_3 = Y_1Y_2Z_1Z_2 - aX_1X_2T_1T_2,
\]

\[
T_3 = Z_1Z_2T_1T_2 - dX_1X_2Y_1Y_2;
\]

and

\[
X'_3 = X_1Y_1Z_2T_2 + X_2Y_2Z_1T_1,
\]

\[
Z'_3 = aX_1X_2T_1T_2 + Y_1Y_2Z_1Z_2,
\]

\[
Y'_3 = X_1Y_2Z_1T_2 - X_2Y_1Z_1T_1,
\]

\[
T'_3 = X_1Y_2Z_2T_1 - X_2Y_1Z_1T_2.
\]

Then \( X_3Z'_3 = X'_3Z_3 \) and \( Y_3T'_3 = Y'_3T_3 \). Furthermore, at least one of the following cases occurs:

- \( (X_3, Z_3) \neq (0, 0) \) and \( (Y_3, T_3) \neq (0, 0) \).
- \( (X'_3, Z'_3) \neq (0, 0) \) and \( (Y'_3, T'_3) \neq (0, 0) \).

5
Proof. Part 1. Observe that

\[ X_3 Z_3' = (X_1 Y_2 Z_2 T_1 + X_2 Y_1 Z_1 T_2)(a X_1 X_2 T_2 + Y_1 Y_2 Z_1 Z_2) = (a X_2^2 T_2 + Y_2^2 Z_2^2)X_1 Y_1 Z_1 T_1 + (a X_1^2 T_2^2 + Y_1^2 Z_1^2)X_2 Y_2 Z_2 T_2 \]

\[ = (Z_2^2 T_2^2 + d X_2^2 Y_2^2)X_1 Y_1 Z_1 T_1 + (Z_1^2 T_1^2 + d X_1^2 Y_1^2)X_2 Y_2 Z_2 T_2 \]

\[ = (X_1 Y_2 Z_2 T_2 + X_2 Y_2 Z_1 T_1)(Z_1 Z_2 T_1 T_2 + d X_1 X_2 Y_1 Y_2) = X_3' Z_3. \]

Similarly

\[ Y_3 T_3' = (Y_1 Y_2 Z_2 Z_2 - a X_1 X_2 T_2)(X_1 Y_2 Z_2 T_1 - X_2 Y_1 Z_1 T_2) \]

\[ = (Y_2^2 Z_2^2 + a X_2^2 T_2^2)X_1 Y_1 Z_1 T_1 - (Y_1^2 Z_1^2 + a X_1^2 T_1^2)X_2 Y_2 Z_2 T_2 \]

\[ = (Z_2^2 T_2^2 + d X_2^2 Y_2^2)X_1 Y_1 Z_1 T_1 - (Z_1^2 T_1^2 + d X_1^2 Y_1^2)X_2 Y_2 Z_2 T_2 \]

\[ = (X_1 Y_2 Z_2 T_2 - X_2 Y_2 Z_1 T_1)(Z_1 Z_2 T_1 T_2 - d X_1 X_2 Y_1 Y_2) = Y_3' T_3. \]

Part 2. Assume that \((X_3, Z_3) = (0,0)\); i.e., \(X_1 Y_2 Z_2 T_1 + X_2 Y_1 Z_1 T_2 = 0 \) and \(Z_1 Z_2 T_1 T_2 + d X_1 X_2 Y_1 Y_2 = 0\). The following calculations show that \((X_3', Z_3') \neq (0,0)\) and \((Y_3', T_3') \neq (0,0)\).

Consider first the possibility that \(T_1 = 0\). Then \(Y_1 \neq 0\) (since \((Y_1 : T_1) \in P^1\)), and the curve equation for \(P_1\) implies \(Z_1^2 = d X_1^2 \) and \(X_1, Z_1 \neq 0\). The equations \(X_1 = 0\) and \(Z_1 = 0\) simplify to \(X_2 T_2 = 0\) and \(X_2 Y_2 = 0\), so \(X_2 = 0\) or \(Y_2 \neq 0\). Now the curve equation for \(P_2\) implies \(Y_2^2 = T_2^2 \) and \(Y_2, T_2 \neq 0\). Hence \(X_3' = X_1 Y_2 Z_2 T_2 \neq 0\) and \(Y_3 = X_1 Y_2 Y_2 T_2 \neq 0\).

Consider next the possibility that \(Z_2 = 0\). Then \(X_2 \neq 0\), and the curve equation for \(P_2\) implies \(a T_2^2 = d Y_2^2 \) and \(Y_2, T_2 \neq 0\). The equations \(X_2 = 0\) and \(Z_2 = 0\) simplify to \(Y_1 = 0\) and \(X_1 Y_2 = 0\), so \(Y_1 = 0\), so \(T_1 \neq 0\). Now the curve equation for \(P_1\) implies \(a X_1^2 = Z_1^2 \) and \(X_1, Z_1 \neq 0\). Hence \(X_3' = X_2 Y_2 Z_1 T_1 \neq 0\) and \(Y_3' = -X_2 Y_2 Z_1 T_1 \neq 0\).

The same arguments, exchanging indices 1 and 2, also apply if \(T_2 = 0\) or if \(Z_1 = 0\). Assume from now on that \(T_1 \neq 0, T_2 \neq 0, Z_1 \neq 0, \) and \(Z_2 \neq 0\).

Multiply the equation \(X_1 Y_2 Z_2 T_1 + X_2 Y_1 Z_1 T_2 = 0\) by \(d X_1 Y_2\), multiply the equation \(Z_1 Z_2 T_1 T_2 + d X_1 X_2 Y_1 Y_2 = 0\) by \(Z_1 T_2\), subtract, and divide by \(Z_2 T_2\), to see that \(d X_1^3 Y_1^2 Z_1^2 = Z_1^2 T_1^2\). Define \(r = X_1 Y_2/(Z_1 T_2);\) then \(r^2 = 1/d\) and \(-r Z_1 T_2 = -X_1 Y_2 Z_2 T_1/(Z_1 T_2) = X_2 Y_1 Z_1 T_2/(Z_1 T_2) = X_1 Y_2 T_1\).

Note that \(X_1, Y_2 \neq 0\) since \(d X_1^2 Y_1^2 = Z_1^2 T_1^2\). Hence \(T_3' \neq 0\); otherwise \(X_1 Y_2 Z_2 T_1 - X_2 Y_1 Z_1 T_2 = 0\) so \(2X_1 Y_2 T_1 = 0\).

Now \(d X_1 Y_1 Z_1' = d X_1 Y_2 Z_2 T_1 + d X_2 Y_1 Z_2 T_1 - d X_1 Y_2 Z_2 T_2 + d(r Z_1 T_2) - r Z_1 T_2 = -a X_1^2 Y_1^2 Z_1^2 T_2 + 1/d^2 = 2 Y_1^2 Z_1^2 = 2 Z_1^2 T_1^2;\) i.e., \(Y_1' = T_1^2\). Hence \(d X_1^2 T_1^2 = Z_1^2 T_1^2 = Z_1^2 T_1^2 = a X_1^2 T_1^2\). Hence \(d = a,\) contradicting the hypothesis that \(a \neq d\).

Part 3. Assume that \((Y_3', T_3') = (0,0)\); i.e., \(Y_1 Y_2 Z_1 Z_2 - a X_1 X_2 T_1 T_2 = 0\) and \(Z_1 Z_2 T_1 T_2 - d X_1 X_2 Y_1 Y_2 = 0\). The following calculations show that \((X_3', Z_3') \neq (0,0)\) and \((Y_3', T_3') \neq (0,0)\).

Consider first \(T_1 = 0\). Then \(Z_1^2 = d X_1^2 \) and \(X_1, Y_1, Z_1 \neq 0\). The equations \(Y_3 = 0\) and \(T_3 = 0\) simplify to \(Y_2 Z_2 = 0 \) and \(X_2 Y_2 = 0\), so \(Y_2 = 0\). Now \(a X_2^2 = Z_2^2 \) and \(X_2, Z_2, T_2 \neq 0\). Hence \(X_3' = X_1 Y_1 Z_2 T_2 \neq 0\) and \(Y_3' = X_1 Y_1 X_2 Z_2 T_2 \neq 0\).

Consider next \(Z_1 = 0\). Then \(a Z_1^2 = d Y_1^2 \) and \(X_1, Y_1, T_1 \neq 0\). The equations \(Y_3 = 0\) and \(T_3 = 0\) simplify to \(X_2 T_2 = 0 \) and \(X_2 Y_2 = 0\), so \(X_2 = 0\). Now \(Y_2^2 = T_2^2 \) and \(Z_2, Y_2, T_2 \neq 0\). Hence \(X_3' = X_1 Y_1 Z_2 T_2 \neq 0\) and \(Y_3' = X_1 Y_1 Z_2 T_2 \neq 0\).

The same arguments apply if \(T_2 = 0\) or \(Z_1 = 0\). Assume from now on that \(T_1 \neq 0, T_2 \neq 0, Z_1 \neq 0, \) and \(Z_2 \neq 0\).

Multiply the equation \(Y_1 Y_2 Z_1 Z_2 - a X_1 X_2 T_1 T_2 = 0\) by \(d Y_1 Y_2\), multiply the equation \(Z_1 Z_2 T_1 T_2 - d X_1 X_2 Y_1 Y_2 = 0\) by \(a T_2\), subtract, and divide by \(Z_2 Z_2\), to see that \(d Y_1^2 Y_2^2 = a T_2^2 T_2^2\). Define \(s = Y_1 Y_2/(T_1 T_2);\) then \(s^2 = a/d\) and \(s Z_2 = Y_1 Y_2 Z_1 Z_2/(T_1 T_2) = a X_1 X_2 T_1 T_2/(T_1 T_2) = a X_1 X_2\).

Note that \(X_1, Y_2 \neq 0\) since \(d Y_1^2 Y_2^2 = a T_2^2 T_2^2 \neq 0\). Hence \(Z_3' \neq 0\); otherwise \(a X_1 X_2 T_1 T_2 + Y_1 Y_2 Z_1 Z_2 = 0\) so \(2 Y_1 Y_2 Z_1 Z_2 = 0\).
We have \(adX_1Y_1 Y'_1 = adX_1^2 Y_1^2 Z_2 T_2 - adX_1 X_2 Y_1 Y_2 Z_1 T_1 = adX_1^2 Y_1^2 Z_2 T_2 - ds^2 Z_2 T_2^2 = (dX_1^2 Y_1^2 - Z_2 T_2^2) a Z_2 T_2\) and also \(aX_1 Y_1 Y'_1 = aX_1^2 Y_1 Y_2 Z_1 T_1 - aX_1 X_2 Y_1 Y_2 Z_1 T_2 = asX_1^2 Y_1 Z_2 T_2^2 - sZ_2 Y_1^2 Z_1^2 T_2 = (aX_1^2 Y_1^2 - Y_1^2 Z_1^2) s Z_2 T_2\).

Suppose that \(Y'_1 = 0\) and \(T'_2 = 0\). Then \(dX_1^2 Y_1^2 = Z_2^2 T_2^2\) and \(aX_1^2 Y_1^2 = Y_1^2 Z_1^2\). As before \(Y_1^2 = T_1^2\), leading to the same contradiction.

\[\square\]

**Theorem 6.2.** Fix a field \(k\) with \(\text{char}(k) \neq 2\). Fix distinct nonzero elements \(a, d \in k\). Fix \(P_1, P_2 \in E_{E, a, d}(k)\). Write \(P_1\) as \(((X_1 : Z_1), (Y_1 : T_1))\) and write \(P_2\) as \(((X_2 : Z_2), (Y_2 : T_2))\). Define \(X_3, Y_3, Z_3, T_3, X'_3, Y'_3, Z'_3, T'_3\) as in Theorem 6.1. Define \(P_3\) as follows:

- \(P_3 = ((X_3 : Z_3), (Y_3 : T_3))\) if \((X_3, Z_3) \neq (0, 0)\) and \((Y_3, T_3) \neq (0, 0)\).
- \(P_3 = ((X'_3 : Z'_3), (Y'_3 : T'_3))\) if \((X'_3, Z'_3) \neq (0, 0)\) and \((Y'_3, T'_3) \neq (0, 0)\).

Then \(P_3 \in E_{E, a, d}(k)\).

**Proof.** Note that by Theorem 6.1 at least one definition of \(P_3\) applies, and both definitions are the same when both cases are applicable.

One can mechanically verify that the polynomial \(aX_3^2 T_3^2 + Y_3^2 Z_3^2 - dX_3^2 Y_3^2\) in \(k[X_1, Z_1, Y_1, T_1, X_2, Z_2, Y_2, T_2]\) factors as \(Q_1 Q_2\) where

\[
Q_1 = (aX_3^2 T_3^2 + Y_3^2 Z_3^2) Z_2^2 T_2^2 - (aX_3^2 T_3^2 + Y_3^2 Z_3^2) dX_3^2 Y_3^2
\]
\[
Q_2 = (aX_3^2 T_3^2 + Y_3^2 Z_3^2) Z_2^2 T_2^2 - (aX_3^2 T_3^2 + Y_3^2 Z_3^2) dX_3^2 Y_3^2.
\]

The curve equations for \(P_1\) and \(P_2\) now imply

\[
Q_1 = (Z_3^2 T_3^2 + dX_3^2 Y_3^2) (Z_2^2 T_2^2) - (Z_3^2 T_3^2) dX_3^2 Y_3^2
\]
\[
= Z_3^2 Z_2 T_3 T_2^2 - dX_3^2 Y_3^2 Z_2^2 Y_3^2
\]
\[
= (Z_3 Z_2 T_3 T_2 - dX_3 X_2 Y_1 Y_2) (Z_3, Z_2 T_3 T_2 - dX_3 X_2 Y_1 Y_2) = Z_3 T_3.
\]

Reverse the roles of \(P_1\) and \(P_2\) to see that \(Q_2 = Z_3 T_3\). Hence \(aX_3^2 T_3^2 + Y_3^2 Z_3^2 - dX_3^2 Y_3^2 = Z_3^2 T_3^2\); i.e., \(((X_3 : Z_3), (Y_3 : T_3)) \in E_{E, a, d}(k)\) in the first case.

The second case is similar. The polynomial \(aX_3^2 T_3^2 + Y_3^2 Z_3^2 - Z_3^2 T_3^2\) factors as \(Q'_1 Q'_2\) where

\[
Q'_1 = (aX_3^2 T_3^2 + Y_3^2 Z_3^2) Z_2^2 T_2^2 - (aX_3^2 T_3^2 + Y_3^2 Z_3^2) Z_3^2 T_3^2
\]
\[
Q'_2 = X_3^2 Y_3^2 (aX_3^2 T_3^2 + Y_3^2 Z_3^2) - X_3^2 Y_3^2 (aX_3^2 T_3^2 + Y_3^2 Z_3^2)
\]

The curve equations now imply

\[
Q'_1 = (Z_3^2 T_3^2 + dX_3^2 Y_3^2) (Z_2^2 T_2^2) - (Z_3^2 T_3^2) dX_3^2 Y_3^2
\]
\[
= d(X_3^2 Y_3^2 Z_2^2 T_2^2 - X_3^2 Y_3^2 Z_3^2 T_3^2)
\]
\[
= d(X_1 Y_1 Z_2 T_2 + X_2 Y_2 Z_1 T_1) (X_1 Y_1 Z_2 T_2 - X_2 Y_2 Z_1 T_1) = dX'_3 Y'_3
\]

and

\[
Q'_2 = X_3^2 Y_3^2 (Z_2^2 T_2^2 + dX_3^2 Y_3^2) - X_3^2 Y_3^2 (Z_3^2 T_3^2) + dX_3^2 Y_3^2
\]
\[
= X_3^2 Y_3^2 Z_3^2 T_3^2 - X_3^2 Y_3^2 Z_3^2 T_3^2 = X'_3 Y'_3.
\]

Hence \(aX_3^2 T_3^2 + Y_3^2 Z_3^2 - Z_3^2 T_3^2 = dX'_3 Y'_3\); i.e., \(((X'_3 : Z'_3), (Y'_3 : T'_3)) \in E_{E, a, d}(k)\) in the second case. \(\square\)
7. Isomorphism between $E_{E,a,d}$ and $E_{M,A,B}$

The projective closure of the Montgomery curve $E_{M,A,B}$ in $P^2$ is
\[
E_{M,A,B} = \{(U : V : W) \in P^2 : BV^2W = U^3 + AU^2W + UW^2\}.
\]

In this section the reader is assumed to be familiar with the standard chord-and-tangent group law on $E_{M,A,B}(k)$.

Theorem 7.1 defines a bijection between $E_{E,a,d}(k)$ and $E_{M,A,B}(k)$, and Theorem 7.3 shows that this bijection is a group isomorphism. For the special case of affine inputs and outputs on an Edwards curve, Theorem 7.3 is equivalent to [1, Theorem 3.2].

**Theorem 7.1.** Fix a field $k$ with $\text{char}(k) \neq 2$. Fix distinct nonzero elements $a, d \in k$. Define $A = 2(a + d)/(a - d)$ and $B = 4/(a - d)$. Then
\[
\begin{aligned}
(X : Z), (Y : T) &\mapsto \begin{cases}
(0 : 0 : 1) &\text{if } ((X : Z), (Y : T)) = ((0 : 1), (-1 : 1)), \\
((T + Y)X : (T + Y)Z : (T - Y)X) &\text{otherwise}
\end{cases},

(U : V : W) &\mapsto \begin{cases}
((0 : 1), (1 : 1)) &\text{if } (U : V : W) = (0 : 1 : 0), \\
((0 : 1), (-1 : 1)) &\text{if } (U : V : W) = (0 : 1 : 0), \\
((U : V), (U - W : U + W)) &\text{otherwise}
\end{cases}
\end{aligned}
\]
is a bijection from $E_{E,a,d}(k)$ to $E_{M,A,B}(k)$, and
\[
\begin{aligned}
\text{is the inverse bijection.}
\end{aligned}
\]

**Proof.** Write $f$ for the first map, and $g$ for the second.

Fix $P \in E_{E,a,d}(k)$. We will show that $f(P) \in E_{M,A,B}(k)$ and $g(f(P)) = P$.

**Case 1:** $P = ((0 : 1), (1 : 1))$. Then $f(P) = (0 : 2 : 0) = (0 : 1 : 0) \in E_{M,A,B}(k)$ and $g(f(P)) = ((0 : 1), (1 : 1)) = P$.

**Case 2:** $P = ((0 : 1), (-1 : 1))$. Then $f(P) = (0 : 0 : 1) \in E_{M,A,B}(k)$ and $g(f(P)) = ((0 : 1), (-1 : 1)) = P$.

**Case 3:** $P \neq ((0 : 1), (1 : 1))$ and $P \neq ((0 : 1), (-1 : 1))$. Write $P$ as $((X : Z), (Y : T))$, and define $U = (T + Y)X, V = (T + Y)Z, W = (T - Y)X$. Then $X \neq 0$. Furthermore $T + Y \neq 0$. Otherwise $aX^2 = dX^2$ from the curve equation so $a = d$, contradiction. Thus $U \neq 0$, and $f(P) = (U : V : W) \in P^2(k)$. Now
\[
BV^2W - (U^3 + AU^2W + UW^2) = \frac{4}{a - d}(T + Y)^2Z^2(T - Y)X
\]
\[
- \left((T + Y)^3X^3 + 2 \frac{a + d}{a - d}(T + Y)^2X^2(T - Y)X + (T + Y)X(T - Y)^2X^2\right)
\]
\[
= \frac{X(T + Y)}{a - d} \left(4(T^2 - Y^2)Z^2 - 2(a + d)(T^2 - Y^2)X^2 - (a - d)X^2((T + Y)^2 + (T - Y)^2)\right)
\]
\[
= \frac{X(T + Y)}{a - d} \left(4Z^2T^2 + 4dX^2Y^2 - 4aX^2T^2 - 4Y^2Z^2\right) = 0
\]
so $f(P) \in E_{M,A,B}(k)$. Furthermore $g(f(P)) = ((U : V), (U - W : U + W)) = (((T + Y)X : (T + Y)Z), ((T + Y)X - (T - Y)X : (T + Y)X + (T - Y)X)) = ((X : Z), (Y : T))$.

Conversely, fix $Q \in E_{M,A,B}(k)$. We will show that $g(Q) \in E_{E,a,d}(k)$ and $f(g(Q)) = Q$.

**Case 1:** $Q = (0 : 1 : 0)$. Then $g(Q) = (0 : 1 : 1) \in E_{E,a,d}(k)$ and $f(g(Q)) = (0 : 1 : 0) = Q$.

**Case 2:** $Q = (0 : 0 : 1)$. Then $g(Q) = ((0 : 1), (-1 : 1)) \in E_{E,a,d}(k)$ and $f(g(Q)) = (0 : 0 : 1) = Q$. 

8
Case 3: \( Q \neq (0 : 1 : 0) \) and \( Q \neq (0 : 0 : 1) \). Write \( Q = (U : V : W) \), and define \((X, Z, Y, T) = (U, V, U - W, U + W)\). Then \( U \neq 0 \) so \( X \neq 0 \) and \( T + Y \neq 0 \) so \( g(Q) = ((X : Z), (Y : T)) \in \mathbb{P}^2(k) \). Now
\[
\begin{align*}
aX^2T^2 - dX^2Y^2 + Y^2Z^2 - Z^2T^2 &= aU^2(U + W)^2 - dU^2(U - W)^2 + (U - W)^2V^2 - V^2(U + W)^2 \\
&= (a - d)U^2(U^2 + W^2) + 2aU^3W + 2dU^3W - 4UVW^2 \\
&= (a - d)U \left(U^3 + \frac{2a + d}{a - d}U^2W + UW^2 - \frac{4}{a - d}V^2W\right) = 0,
\end{align*}
\]
so \( g(Q) \in \mathbb{F}_{E,a,d}(k) \), and \( f(g(Q)) = ((T + Y)X : (T + Y)Z : (T - Y)V) = (2U^2 : 2UV : 2WU) = (U : V : W) = Q. \)

\[ \square \]

Hilfsslemmma 7.2. Fix a field \( k \) with \( \text{char}(k) \neq 2 \). Fix distinct nonzero elements \( a, d \in k \). Fix \( P_1, P_2 \in \mathbb{F}_{E,a,d}(k) \). Write \( P_1 \) as \(((X_1 : Z_1), (Y_1 : T_1))\) and write \( P_2 \) as \(((X_2 : Z_2), (Y_2 : T_2))\). Then \( P_1 + P_2 = ((0 : 1), (-1 : 1)) \) if and only if \((X_2 : Z_2) = (X_1 : Z_1) \) and \((Y_2 : T_2) = (-Y_1 : T_1)\).

\[ \text{Proof.} \quad \text{Define} \quad X_3, Y_3, Z_3, T_3, X'_3, Z'_3, T'_3, \text{as in} \quad \text{Theorem} \quad \text{6.1.} \quad \text{If} \quad (X_2 : Z_2) = (X_1 : Z_1) \quad \text{and} \quad (Y_2 : T_2) = (-Y_1 : T_1) \quad \text{then} \quad X_3' = 0, \quad Y_3' = -T_3', \quad Z_3 = 0, \quad \text{and (from the curve equation)} \quad Y_3 = -T_3, \quad \text{so} \quad P_1 + P_2 = ((0 : 1), (-1 : 1)).
\]

Conversely, assume that \( P_1 + P_2 = ((0 : 1), (-1 : 1)) \). Then either \((X_1 : Z_1), (Y_1 : T_1)\) = \((0 : 1), (-1 : 1))\) or \((X'_3 : Z'_3), (Y'_3 : T'_3)\) = \((0 : 1), (-1 : 1))\) or both. Either way \( X_3 = 0 \) and \( Y_3 + T_3 = 0 \); in the case \((X'_3 : Z'_3), (Y'_3 : T'_3)\) = \((0 : 1), (-1 : 1))\) this follows from \( X_3X_3' = X_1'Z_3' \) and \( Y_3T_3' = Y_1T_3'. \)

Note for future reference that, since \((Y_3 : T_3) = (-1 : 1) \) or \((Y'_3 : T'_3) = (-1 : 1) \), it is not possible to have simultaneously \( Y_3 = T_3 \) and \( Y'_3 = T'_3 \).

First consider the case \( T_1 = 0 \). Then \( X_1, Y_1, Z_1 \neq 0 \). Now \( X_1 = 0 \) implies \( X_2T_2 = 0 \) so \( Y_2 \neq 0 \); and \( Y_3 + T_3 = 0 \) implies \( Y_1'Y_2Z_2Z_2' - dX_1X_2Y_2 = 0 \), i.e., \( Y_1(Y_2(Z_2' - dX_1X_2) = 0 \) so \( Z_1Z_2 = dX_1X_2 \). If \( X_2 = 0 \) then \( Z_2 = 0 \), contradiction; hence \( X_2 = 0 \) and \( T_2 = 0 \). Now both \( P_1 \) and \( P_2 \) have the form \(((1 : \pm \sqrt{d}), (1 : 0))\), and the equation \( Z_1Z_2 = dX_1X_2 \) implies that the square-root signs are the same.

Hence \((X_2 : Z_2) = (X_1 : Z_1) \) and \((Y_2 : T_2) = (1 : 0) = (-Y_1 : T_1)\).

Similar comments apply if \( T_2 = 0 \). Assume from now on that \( T_1 \neq 0 \) and \( T_2 \neq 0 \).

Next consider the case \( X_2 = 0 \). Then \( Z_2, Y_2, T_2 \neq 0 \). Now \( X_3 = 0 \) implies \( X_1 = 0 \) so \( Z_1 \neq 0 \). Now both \( P_1 \) and \( P_2 \) have the form \(((0 : 1), (\pm 1 : 1))\). The equation \( Y_3 + T_3 = 0 \) implies \( Z_1Z_2(Y_1Y_2 + T_1T_2) = 0 \) so \( Y_1Y_2 = -Y_3T_2 \); i.e., \( P_1 \) and \( P_2 \) have opposite signs in the \( \pm 1 \). Hence \((X_2 : Z_2) = (X_1 : Z_1) \) and \((Y_2 : T_2) = (-Y_1 : T_1)\).

Similar comments apply if \( X_1 = 0 \). Assume from now on that \( X_1 \neq 0 \) and \( X_2 \neq 0 \).

Next consider the case \( Z_1 = 0 \). Now \( X_2 = 0 \) implies \( Y_2Z_2 = 0 \), and \( Y_3 + T_3 = 0 \) implies \( -aX_1X_2T_1T_2 - dX_1X_2Y_2 = 0 \), i.e., \( X_1X_2(\alpha T_1T_2 + dY_1Y_2) = 0 \), so \( aT_1T_2 + dY_1Y_2 = 0 \). In particular \( Y_2 \neq 0 \) (since \( aT_1T_2 \neq 0 \)) so \( Z_2 = 0 \). Now both \( P_1 \) and \( P_2 \) have the form \(((1 : 0), (\pm \sqrt{a/d} : 1))\), and the equation \( aT_1T_2 + dY_1Y_2 = 0 \) implies \( P_1 \) and \( P_2 \) have opposite signs in the \( \pm \sqrt{a/d} \). Hence \((X_2 : Z_2) = (X_1 : Z_1) \) and \((Y_2 : T_2) = (-Y_1 : T_1)\).

Similar comments apply if \( Z_2 = 0 \). Assume from now on that \( Z_1 \neq 0 \) and \( Z_2 \neq 0 \).

The equation \( X_3 = 0 \) is \( X_2Y_1Z_1T_2 = -X_1Y_2Z_2T_1 \), and the equation \( Y_3 + T_3 = 0 \) is \( Y_1Y_2Z_1Z_2 - aX_1X_2T_1T_2 + Z_1Z_2T_1T_2 - dX_1X_2Y_2 = 0 \). Multiply the second equation by \( X_2Z_1T_2 \), eliminate \( X_2Y_1Z_1T_2 \) using the first equation, and use \( T_1 \neq 0 \), to obtain
\[
-X_1Z_1(Y_2^2Z_2^2 + aX_2^2T_2^2) + X_2Z_2(Z_1^2T_1^2 + dX_1^2Y_1^2) = 0.
\]

Now use the \( P_2 \) curve equation to see that
\[
-X_1Z_1(Z_2^2T_2^2 + dX_2^2Y_2^2) + X_2Z_2(Z_1^2T_1^2 + dX_1^2Y_1^2) = 0,
\]
i.e., \((X_2Z_1 - X_1Z_2)(Z_1Z_2T_1^2 - dX_1X_2Y_2^2) = 0.\)
Suppose \( X_2Z_1 \neq X_1Z_2 \). Then \( Z_1Z_2T_2^2 = dX_1X_2Y_2^2 \). Multiply this equation by \( X_1X_2^2Z_1^2T_1^2 \), use the \( P_2 \) curve equation, and rearrange to obtain

\[
(X_2Z_1 + X_1Z_2)X_1X_2Z_1^2Z_2T_1^2T_2^2 = X_1^2X_2Z_1^2T_2^2(aX_2^2T_2^2 + Y_2^2Z_2^2).
\]

Multiply the \( P_1 \) curve equation by \( X_2^2Z_1^2T_1^2 \), replace \( X_2^2Y_1^2Z_1^2T_2^2 \) with \( X_1^2Y_1^2Z_2^2T_1^2 \) (twice), and replace \( dX_1X_2Y_2 = Z_1Z_2T_2^2 \) to obtain

\[
X_1^2X_2Z_1^2T_1^2(aX_2^2T_2^2 + Y_2^2Z_2^2) = Z_1T_1^2T_2^2(X_2^2Z_1^2 + X_2^2Z_2^2).
\]

Hence

\[
(X_2Z_1 + X_1Z_2)X_1X_2Z_1^2Z_2T_1^2T_2^2 = Z_1T_1^2T_2^2(X_2^2Z_1^2 + X_2^2Z_2^2);
\]

i.e., \( (X_2Z_1 - X_1Z_2)^2(X_2Z_1 + X_1Z_2)T_1^2T_2^2 = 0 \). Hence \( X_2Z_1 + X_1Z_2 = 0 \). The equation \( X_3 = 0 \) then implies \( X_2Z_1(Y_1T_2 - Y_2T_1) = 0 = Y_1T_2 - Y_2T_1 \). Hence \( Y_3 = X_1Y_1Z_2T_2 - X_2Y_2Z_1T_1 = X_1Y_2Z_2T_1 - X_2Y_1Z_2T_2 = T_3 \) and

\[
Y_1Z_1T_1 = Y_1Y_2Z_2^2T_2T_1 - aX_1X_2Z_1T_2^2T_2
= (Y_1^2Z_1^2 + aX_2^2T_2^2)Z_2T_2
= (Z_1^2T_1^2 + dX_2^2Y_2^2)Z_2T_2
= Z_1^2Z_2T_2T_2 - dX_1X_2Y_1Z_2T_1 = T_3Z_1T_1
\]

so \( Y_3 = T_3 \). Contradiction.

Hence \( X_2Z_1 = X_1Z_2 \). Then \( X_3 = 0 \) implies \( X_2Y_1Z_2T_2 = -X_2Y_2Z_1T_1 = -X_2Y_2Z_1T_1 \), i.e., \( X_2Z_1(Y_1T_2 + Y_2T_1) = 0 \). Both \( X_2 \) and \( Z_1 \) are nonzero so \( Y_1T_2 + Y_2T_1 = 0 \) so \( (X_2 : Z_2) = (X_1 : Z_1) \) and \( (Y_2 : T_2) = (-Y_1 : T_1) \).

\[ \square \]

**Theorem 7.3.** Fix a field \( k \) with \( char(k) \neq 2 \). Fix distinct nonzero elements \( a, d \in k \). Define \( A = 2(a + d)/(a - d) \) and \( B = 4/(a - d) \). Define \( f : \mathbb{F}_{E,a,d}(k) \to \mathbb{F}_{M,A,B}(k) \) as the bijection in Theorem 7.1. Then \( f(P_1 + P_2) = f(P_1) + f(P_2) \) for all \( P_1, P_2 \in \mathbb{F}_{E,a,d}(k) \).

**Proof.** Write \( P_1 \) as \( ((X_1 : Z_1), (Y_1 : T_1)) \) and write \( P_2 \) as \( ((X_2 : Z_2), (Y_2 : T_2)) \). Define \( X_3, Z_3, Y_3, T_3, X_3', Z_3', Y_3', T_3' \) as in Theorem 6.1.

There are several cases in the definition of addition on \( \mathbb{F}_{M,A,B} \), and we split the proof into several cases accordingly.

**Case 1:** \( P_1 = ((0 : 1), (1 : 1)) \). Then \( f(P_1) = (0 : 1 : 0) \) so on \( \mathbb{F}_{E,a,d} \) we have \( f(P_1) + f(P_2) = f(P_2) \).

Now \( (X_3 : Z_3) = (X_2T_2 : Z_2T_2) \) and \( (Y_3 : T_3) = (Y_2Z_2 : Z_2T_2) \) so if \( (X_3, Z_3) \neq (0,0) \) and \( (Y_3, T_3) \neq (0,0) \) then \( P_1 + P_2 = ((X_3 : Z_3), (Y_3 : T_3)) = ((X_2T_2 : Z_2T_2), (Y_2Z_2 : Z_2T_2)) = P_2 \).

Similarly \( (X_3' : Z_3') = (X_2Y_2 : Y_2Z_2) \) and \( (Y_3' : T_3') = (X_2Y_2 : X_2T_2) \) so if \( (X_3', Z_3') \neq (0,0) \) and \( (Y_3', T_3') \neq (0,0) \) then \( P_1 + P_2 = ((X_3' : Z_3'), (Y_3' : T_3')) = ((X_2Y_2 : Y_2Z_2), (Y_2Z_2 : Z_2T_2)) = P_2 \).

**Case 2:** \( P_2 = ((0 : 1), (1 : 1)) \). Exchange indices 1 and 2 above to see that \( P_1 + P_2 = P_1 \) so \( f(P_1 + P_2) = f(P_1) + f(P_2) \).

**Case 3:** \( P_2 = ((-X_1 : Z_1), (Y_1 : T_1)) \) and \( P_1 \neq ((0 : 1), (1 : 1)) \).

If \( P_1 = ((0 : 1), (-1 : 1)) \) then \( P_2 = P_1 \) so \( f(P_2) = f(P_1) = (0 : 0 : 1) \). Furthermore \( P_1 + P_2 = ((0 : 1) : 0) = (0 : 0 : 1) = f(P_1) + f(P_2) \).

If \( P_1 = ((1 : 0), (0 \pm a/d : d)) \) then \( P_2 = P_1 \) so \( f(P_2) = f(P_1) = (1 \pm \sqrt{a/d} : 0 : 1 \mp \sqrt{a/d}) \). Furthermore \( (X_3 : Z_3) = (0 : 1) \) and \( (Y_3 : T_3) = (a : -d \sqrt{a/d}) = (1 : 1) \) so \( P_1 + P_2 = ((0 : 1), (1 : 1)) \) so \( f(P_1 + P_2) = (0 : 1 : 0) = (0 : 0 : 1) = f(P_1) + f(P_2) \).

Otherwise \( X_1, Z_1 \neq 0 \) and \( P_1, P_2 \neq P_1 \). Now \( X_1' = 0 \) and \( Y_1' = T_1' \) and \( X_3 = 0 \) and (by the \( P_1 \) curve equation) \( Y_3 = T_3 \), so \( P_2 = P_1 = ((0 : 1), (1 : 1)) \). Put \( (U_1 : V_1 : W_1) = f(P_1) \) then \( f(P_2) = (-U_1 : V_1 : -W_1) = (U_1 : -V_1 : W_1) = -f(P_1) \) so \( f(P_1) + f(P_2) = (0 : 1 : 0) = f(P_1 + P_2) \).

**Case 4:** \( P_2 = P_1 \) and \( P_1, P_2 \neq ((0 : 1), (1 : 1)) \).

Note that \( X_1, Z_1 \neq 0 \) since otherwise \( (X_1 : Z_1) = (X_1 : Z_1) \). Furthermore \( T_1 + Y_1 \neq 0 \) since otherwise \( aX_2^2Z_1^2Z_2 = Z_1^2 + dX_2^2 \), forcing \( a = d \). Note also that \( (Y_3', T_3') = (0,0) \) and thus \( P_1 + P_2 = ((X_3 : Z_3), (Y_3 : T_3)) \).
Again put \((U_1 : V_1 : W_1) = f(P_1)\). Then \(V_1 \neq 0\) since \((T_1 + Y_1)Z_1 \neq 0\).

If \(Y_1 = 0\) then \(aX_1^2 = Z_1^2\) and \((U_1 : V_1 : W_1) = (1 : \pm \sqrt{a} : 1)\). The tangent line at \((U_1 : V_1 : W_1)\) on \(E_{M,A,B}\) has slope \((3u_1^2 + 2aU_1W_1 + T_1^2)/(2BV_1W_1) = (a-d + a + d)/(\pm 2\sqrt{a}) = \pm \sqrt{a} = V_1/U_1\) and therefore passes through \((0 : 0 : 1)\).

If \(T_1 = 0\) then \(Z_1 = dX_1^2\) and \((U_1 : V_1 : W_1) = (-1 : \pm \sqrt{d} : 1)\). The tangent line at \((U_1 : V_1 : W_1)\) on \(E_{M,A,B}\) has slope \((3u_1^2 + 2aU_1W_1 + T_1^2)/(2BV_1W_1) = (a-d - a - d)/(\pm 2\sqrt{d}) = \mp \sqrt{d} = V_1/U_1\) and therefore passes through \((0 : 0 : 1)\).

Either way \(P_1 + P_2 = ((0 : 1), (1 : 1))\) and \(f(P_1 + P_2) = (0 : 0 : 1) = f(P_1) + f(P_2)\).

Otherwise \(X_1, Y_1, Z_1, T_1 \neq 0\) so \(X_3 = 2X_1Y_1Z_1T_1 \neq 0, Z_3 = Z_1^2T_1^2 + dX_1^2Y_1^2 = aX_1^2T_1^2 + Y_1^2Z_1^2, Y_3 = Y_1^2Z_1^2 - aX_1^2T_1^2,\) and \(T_3 = Z_1^2T_1^2 - dX_1^2Y_1^2\). Thus \(f(P_1 + P_2) = ((T_3 + Y_3)X_3; (T_3 + Y_3)Z_3; (T_3 - Y_3)X_3)\).

The tangent line through \(f(P_1) = ((T_1 + Y_1)X_1; (T_1 + Y_1)Z_1; (T_1 - Y_1)X_1)\) on \(E_{M,A,B}\) has slope \((3u_1^2 + 2aU_1W_1 + T_1^2)/(2BV_1W_1)\). The following script in the Sage computer-algebra system\(^{19}\) verifies that this line passes through \(-f(P_1 + P_2)\):

```plaintext
R.<a,d,X1,Z1,Y1,T1>=QQ[]
A=2*(a+d)/(a-d)
B=4/(a-d)
S=R.quotient([a*X1^2*Z1^2+Y1^2-2*Z1^2*T1+2*X1*Y1*Z1*T1+X1*Y1*Z1^2+X1*Y1*Z1*T1+X1*Y1*Z1]);
X3=X1*Y1*Z1*T1+X1*Y1*Z1*T1+X1*Y1*Z1*T1+X1*Y1*Z1*T1;
Y3=Y1*Y1*Z1^2-a*X1*Y1*Z1*T1;

8. Special cases

The neutral element of $\mathbb{E}_{E,a,d}$ is $((0 : 1), (1 : 1))$.

The negative of $((X_1 : Z_1), (Y_1 : T_1)) \in \mathbb{E}_{E,a,d}$ is $((-X_1 : Z_1), (Y_1 : T_1))$. This implies in particular that points of order 2 have $(X_1 : Z_1) \in \{(0 : 1), (1 : 0)\}$.

Theorem 8.1 below gives linear characterizations of the pairs $(P_1, P_2) \in \mathbb{E}_{E,a,d} \times \mathbb{E}_{E,a,d}$ that can be added by each of our addition laws. For example, the dual addition law fails for all doublings, so the original addition law works for all doublings. One can also express the exceptional divisors as functions of the dual addition law from the original addition law. Specifically, add $((1 : (\sqrt{d} : aT_Y) : 0), Z_1)$, using the original addition law; and then subtract $((1 : dY_T : 1), (0 : 1))$, using the $\sqrt{d}$ formula. The final result is exactly the dual addition law for $((X_1 : Z_1), (Y_1 : T_1))$ and $(Z_1 : 0)$. Applying the same rotation to the dual addition law recovers the original addition law; this justifies our “dual” terminology. Rotating the exceptional cases for the original addition law produces the exceptional cases for the dual addition law.

**Theorem 8.1.** Fix a field $k$ with char($k$) $\neq 2$. Fix distinct nonzero elements $a, d \in k$. Fix $P_1, P_2 \in \mathbb{E}_{E,a,d}(k)$. Write $P_1$ as $((X_1 : Z_1), (Y_1 : T_1))$ and write $P_2$ as $((X_2 : Z_2), (Y_2 : T_2))$. Define $X_3, Y_3, Z_3, T_3, X_3', Y_3', Z_3', T_3'$ as in Theorem 6.1. Then

- $(X_3, Z_3) = (0, 0)$ if and only if $P_2 = ((T_1 : \pm \sqrt{d}Y_1), (Z_1 : \mp \sqrt{d}X_1))$.
- $(Y_3, T_3) = (0, 0)$ if and only if $P_2 = ((\pm a/dZ_1 : aX_1), (\pm a/dT_1 : Y_1))$.
- $(X_3', Z_3') = (0, 0)$ if and only if $P_2 = ((Y_1 : \pm \sqrt{a}T_1), (\mp \sqrt{a}X_1 : Z_1))$.
- $(Y_3', T_3') = (0, 0)$ if and only if $P_2 = ((\pm X_1 : Z_1), (\pm Y_1 : T_1))$.

**Proof.**

**Part 1.** Assume without loss of generality that $(X_3, Z_3, Y_3, T_3) = ((T_1 : \mp \sqrt{d}Y_1), (Z_1 : \mp \sqrt{d}X_1))$. Then $X_3 = X_1Y_2Z_2T_1 + X_2Y_1Z_2T_1 = X_1Z_1(\pm \sqrt{d}Y_1)T_1 + T_1Y_1Z_1(\pm \sqrt{d}X_1) = 0$ and $Z_3 = Z_1Z_2T_3 + dX_1X_2Y_1Z_3 = Z_1(\pm \sqrt{d}Y_1)T_1(\pm \sqrt{d}X_1) + dX_1T_1Y_1Z_1 = 0$.

Conversely, assume that $(X_3, Z_3) = (0, 0)$. If $T_1 = 0$ then $Z_3 = dX_1^2$ and $Z_3 = 0$ and $Y_3 = T_3^2$, as shown before in Part 2 of the proof of Theorem 6.1. Write $s = -Z_1T_2/(X_1Y_2)$; then $s^2 = d$ and $((T_1 : sY_1), (Z_1 : -sX_1)) = ((0 : 1), (Y_2 : T_2)) = ((X_2 : Z_2), (Y_2 : T_2))$.

If $Z_3 = 0$ then $aT_3^2 = dY_3^2$ and $Y_3 = 0$ and $aX_3^2 = Z_3^2$, as shown before. Again write $s = -Z_1T_2/(X_1Y_2)$; then $s^2 = d$ and $((T_1 : sY_1), (Z_1 : -sX_1)) = ((1 : 0), (Y_2 : T_2)) = ((X_2 : Z_2), (Y_2 : T_2))$.

Similar comments apply if $T_2 = 0$ or $Z_1 = 0$. The only remaining case is that $Z_1, Z_2, T_1, T_2 \neq 0$. Then $X_1Y_2 = rZ_1T_2$ and $X_2Y_1 = -rZ_2T_1$ for some $r$ satisfying $r^2 = 1/d$, as shown before. Write $s = -1/r$; then $s^2 = d$ and $((T_1 : sY_1), (Z_1 : -sX_1)) = ((X_2 : Z_2), (Y_2 : T_2))$.

**Part 2.** Assume without loss of generality that $(X_3, Z_3, Y_3, T_3) = (\pm a/dZ_1, aX_1, \pm a/dT_1, Y_1)$. Then $Y_3 = Y_1Y_2Z_2 - aX_1X_2T_1T_2 = Y_1(\pm a/dT_1)Z_1aX_1 - aX_1(\pm a/dZ_1)T_1Y_1 = 0$ and $T_3 = Z_1Z_2T_2 - dX_1X_2Y_1Z_2 = Z_1aX_1T_1Y_1 - dX_1(\pm a/dZ_1)Y_1(\pm a/dT_1) = 0$.

Conversely, assume that $(Y_3, T_3) = (0, 0)$.
If $T_1 = 0$ then $Z_1^2 = dX_1^2$ and $Y_2 = 0$ and $aX_2^2 = Z_2^2$, as shown before in Part 3 of the proof of Theorem 6.1. Write $s = aX_1X_2/(Z_1Z_2)$; then $s^2 = a/d$ and $((sZ_1 : aX_1), (sT_1 : Y_1)) = ((X_2 : Z_2), (0 : 1)) = ((X_2 : Z_2), (Y_2 : T_2)).$

If $Z_1 = 0$ then $aT_1^2 = dY_1^2$ and $X_2 = 0$ and $Y_2^2 = T_2^2$, as shown before. Write $s = Y_1/Y_2/(T_1/T_2)$; then $s^2 = a/d$ and $((sZ_1 : aX_1), (sT_1 : Y_1)) = ((0 : 1), (Y_2 : T_2)) = ((X_2 : Z_2), (Y_2 : T_2)).$

Similar comments apply if $T_2 = 0$ or $Z_2 = 0$. The only remaining case is that $Z_1, Z_2, T_1, T_2 \neq 0$. Then $Y_1Y_2 = ST_2T_2$ and $aX_1X_2 = Z_1Z_2$ for some $s$ satisfying $s^2 = a/d$, as shown before, so $((Z_1 : X_1), (T_1 : Y_1)) = ((X_2 : Z_2), (Y_2 : T_2)).$

**Part 3.** Assume without loss of generality that $(X_2, Z_2, Y_2, T_2) = (Y_1, \pm \sqrt{a} T_1, \pm \sqrt{a} X_1, Z_1)$. Then $X'_3 = X_1Y_1Z_2T_2 + X_2Y_2Z_2T_1 = X_1Y_1(\pm \sqrt{a} T_1)Z_1 + Y_1(\pm \sqrt{a} X_1)Z_1T_1 = 0$ and $Z'_3 = aX_1X_2T_1T_2 + Y_1Y_2Z_1Z_2 = aX_1Y_1T_1Z_1 + Y_1(\pm \sqrt{a} X_1)Z_1(\pm \sqrt{a} T_1) = 0$.

Conversely, assume that $(X'_3, Z'_3) = (0, 0)$. If $X_1 = 0$ then $X_2Y_2 = 0$ and $Y_2Z_2 = 0$ so $Y_2 = 0$. Furthermore $Y_2 = T_1^2$ and $aX_2^2 = Z_2^2$. Write $r = Y_1Z_2/(X_2T_1)$; then $r^2 = a$ and $((Y_1 : rT_1), (rX_1 : Z_1)) = ((X_2 : Z_2), (0 : 1)) = ((X_2 : Z_2), (Y_2 : T_2)).$

If $T_1 = 0$ then $Z_2T_2 = 0$ and $Y_2Z_2 = 0$ so $Z_2 = 0$. Furthermore $Z_2 = dX_2^2$ and $T_1^2 = dY_2^2$. Write $r = -Y_2Z_1/(X_1T_2)$; then $r^2 = a$ and $rX_2T_1 - X_2Y_2Z_1/(X_1T_2) = X_1Y_1Z_2T_2/(X_2T_1) = Y_1Z_2$ so $((Y_1 : rT_1), (rX_1 : Z_1)) = ((X_2 : Z_2), (Y_2 : T_2)).$

**Part 4.** Assume now that $(X_2, Z_2, Y_2, T_2) = (\pm X_1, Z_1, \pm Y_1, T_1)$. Then $X'_3 = X_1Y_1Z_2T_2 - X_2Y_2Z_1T_1 = X_1Y_1Z_2T_1 - (\pm X_1)(\pm Y_1)Z_1T_1 = 0$ and $T'_1 = X_1Y_2Z_2T_1 - X_2Y_1Z_1T_1 = (\pm Y_1)(\pm X_1)Z_1T_1 = 0$.

Conversely, assume that $(Y'_1, Z'_1) = (0, 0)$. If $X_1 = 0$ then $X_2Y_2 = 0$ and $X_2T_2 = 0$ so $X_2 = 0$. If $Z_1 = 0$ then $Z_2T_2 = 0$ and $Y_2Z_2 = 0$ so $Z_2 = 0$. If $Y_1 = 0$ then $X_2Y_2 = 0$ and $X_2T_2 = 0$ so $Y_2 = 0$. If $T_1 = 0$ then $Z_2T_2 = 0$ and $X_2T_2 = 0$ so $T_2 = 0$. In all four cases one sees easily that $((X_1 : Z_1), (Y_1 : T_1)) = ((X_2 : Z_2), (Y_2 : T_2))$ for some $r \in \{-1, 1\}$. Similar comments apply if $X_2 = 0$ or $Z_2 = 0$ or $Y_2 = 0$ or $T_2 = 0$.

In the remaining case $X'_1Y'_2Z'_2T'_2 = X_1X_2Y_2Z_2Z_1T_1 - X_2^2Y_2Z_2^2T_2$ so $X'_1Z'_2^2 = X_2^2Z_1^2$. Write $r = X'_2Z_1/(X_2T_2)$. Then $r \in \{-1, 1\}$ and $rY_1T_2 = X_1Y_2Z_2T_2/(X_1Z_2) = X_1Y_2Z_2T_1/(X_1Z_2) = Y_1T_2$ so $((X_1 : Z_1), (rY_1 : T_1)) = ((X_2 : Z_2), (Y_2 : T_2))$. □
